Education

National Institute Of Technology Warangal **Aug 2025 - Aug 2029**
Bachelor of Technology in Computer Science and Engineering *Warangal, Telangana*

Projects

One-Shot Face Stylization | *Python, PyTorch, StyleGAN2, FastAPI, JavaScript* | GitHub **September 2026**

- Built a full-stack web application that converts real human faces into different art styles like Anime, Sketch, and Cyberpunk.
- Used **e4e** and **StyleGAN2** models in **PyTorch** to apply artistic styles to uploaded photos while keeping the person's facial features recognizable.
- Created a **FastAPI** backend that loads the AI models on startup to process images quickly and send the generated art back to the browser.
- Designed a frontend using **JavaScript** and **Tailwind CSS** to handle image uploads, prevent browser timeouts during processing, and show live status updates.

Real-Time Sign Language Translator (Computer Vision) | *Python, TensorFlow, MediaPipe, OpenCV, Streamlit***October 202**

- Built a web application that translates 10 sign language gestures into text in real time using a webcam.
- Used MediaPipe to track hand and body movements and trained an LSTM deep learning model to recognize gestures across 30 video frames.
- Deployed a live browser interface with Streamlit and WebRTC, adding custom logic to prevent duplicate words and form clear, continuous sentences.

AI Language Translator (NLP) | *Python, PyTorch, Hugging Face, Transformers, Streamlit* **October 2026**

- Built a web application that translates text across 200+ languages in real time using Meta's NLLB-200 deep learning model.
- Implemented a complete translation pipeline using Hugging Face tokenizers and PyTorch to process user text and generate accurate translations.
- Optimized app speed and memory usage by caching the 600M-parameter model in Streamlit and disabling gradient calculations during translation.

US Election Data Analysis | *Python, Pandas, NumPy* **October 2026**

- Analyzed historical US election datasets using Pandas and NumPy to uncover voting patterns and demographic trends across 50 states.
- Cleaned and processed raw data by handling missing values, removing duplicates, and standardizing state and county-level records.
- Calculated key metrics such as voter turnout percentages, winning margins, and party swing rates using fast NumPy array operations.

Movie Recommendation System(Machine Learning) | *Python, Scikit-Learn, Pandas, NumPy, Streamlit* **August 2026**

- Developed an interactive web application that recommends the top most relevant movies in real time using the TMDB 5,000 dataset.
- Preprocessed movie metadata including genres, cast, crew, and keywords using Pandas, converting combined text features into vectors with Scikit-Learn.
- Computed pairwise Cosine Similarity scores across 4,800+ movies to evaluate content similarity and generate personalized suggestions.
- Built a clean, responsive user interface with Streamlit, enabling users to search any title and view recommendations instantly.

Technical Skills and Interests

Languages: Python (NumPy, Pandas), C++
Developer Tools: Git, GitHub, VS Code, Jupyter Notebook
Technologies/Frameworks: Scikit-Learn, TensorFlow, Keras, PyTorch, Hugging Face, OpenCV, Streamlit
Core Skills: Machine Learning, Deep Learning, Data Analysis
